

ROMAN CHORNYI

SENIOR IOS / SWIFT ENGINEER

ABOUT ME & CONTACTS

iOS engineer with 3+ years of experience building and shipping production apps in Swift, SwiftUI and UIKit — from product UI and app architecture down to networking, persistence and native cryptographic cores.

Email: ppgora352@gmail.com · **Telegram:** @DekoyInDekoy · **LinkedIn:** Roman Chornyi · **GitHub:** @jeanpierreroma · **Location:** Khmelnytskyi, Ukraine

SUMMARY

- **Swift and SwiftUI product engineering.** 3+ years shipping production iOS apps with Swift, SwiftUI, UIKit and Objective-C interop. MVVM, Clean Architecture and Coordinators with dependency injection and modular feature packages; Swift Concurrency (async/await, actors) and Combine; Auto Layout, accessibility (VoiceOver), localisation, and releases through App Store Connect and TestFlight.
- **Networking, data and performance.** REST and gRPC clients on URLSession with async/await — pagination, retries, caching, offline-first synchronisation and typed error handling. Persistence with Core Data, SwiftData, SQLite and Keychain, and profiling in Instruments to remove memory, CPU and rendering hotspots.
- **Platform depth and delivery quality.** Native integrations beyond the usual app layer: Rust and C/C++ cores over a C ABI FFI, XCFrameworks, cryptography and secure storage, push notifications, deep links and StoreKit 2. Backed by XCTest unit and UI coverage, code review, and CI/CD pipelines driving automated builds and TestFlight distribution.

SKILLS

- **Languages:** Swift 6, Objective-C, Rust, C/C++, SQL, AppleScript / JXA.
- **UI:** SwiftUI, UIKit, Combine, Swift Charts, Auto Layout, Core Animation, design systems, accessibility (VoiceOver), localisation, dark mode.
- **Architecture:** MVVM, MVC, Coordinators, Clean Architecture, SOLID, dependency injection, modular and feature-based packages, protocol-oriented design.
- **Concurrency:** Swift Concurrency (async/await, Task, actor, Sendable, AsyncStream), GCD, strict concurrency, background processing.
- **Networking:** REST, gRPC, URLSession, SwiftProtobuf, Codable / JSON, streaming, retry and reconnect, offline-first caching, error handling and observability.
- **Data & storage:** Core Data, SwiftData, SQLite, Keychain, UserDefaults, migrations, caching.
- **Platform & integrations:** Push notifications (APNs), deep and universal links, StoreKit 2 / in-app purchases, AVFoundation, Vision / OCR, biometrics (Face ID, Touch ID), app extensions, Rust FFI (C ABI), XCFramework integration, cryptography and secure storage.
- **Testing & tooling:** XCTest, Swift Testing, UI tests, Instruments profiling, Xcode, Swift Package Manager, CocoaPods, Git, GitHub, CI/CD, Fastlane, TestFlight, App Store Connect, code review, Agile / Scrum.

RECENT PROJECTS

DASH – SENIOR IOS / SWIFT ENGINEER

FEBRUARY 2026 – AUGUST 2026

Industry: Cryptocurrency & Blockchain Infrastructure

Building the iOS Dash cryptocurrency wallet and the cross-platform core behind it — work spanning the SwiftUI app, a shared UI package, and the Rust wallet core with its Swift and Kotlin SDKs.

- Contributed to the wallet's migration off its legacy Objective-C sync layer onto a Rust core reached over a C ABI FFI — moving sends, swap routing, transaction matching and identity startup onto the new SDK boundary.
- Redesigned the wallet's core money flows in SwiftUI — send, receive, internal transfer and a tabbed payments landing — including send-to-contact through the standard send pipeline and a shared source picker driven by spendable balance.
- Built the notifications module end to end: dispatcher, permission and lifecycle handling, deep-link router, persistent store, per-transaction producers, background refresh and unified read-state with search.
- Implemented dApp authorization over deep links, letting a user approve a login or an in-app purchase request from a connected web app without scanning a QR code.
- Contributed to the shared Rust wallet core and its FFI layer — transaction building, coin selection, balance reporting and chain synchronisation — carrying each change through the Swift and Kotlin SDKs, and hardening correctness around spendable balances and state consistency.
- Shipped accessibility as infrastructure — a VoiceOver audit tool plus a CI check that fails the build on unlabeled controls — then closed the gaps it found across the app and the shared UI package.
- Maintained the shared SwiftUI UI package used across the app: bottom sheets, a numeric keypad, reusable cards, and a themed icon set with light and dark appearances.
- Integrated third-party financial services — cross-chain swaps, a built-in DEX, staking, gift cards and a merchant directory — and worked on privacy features for shielded, mixed transactions.

Technologies: Swift 6, SwiftUI, UIKit, Objective-C, Swift Concurrency, Combine, Rust, Rust FFI (C ABI), XCFramework, gRPC, SwiftProtobuf, REST, SwiftData, SQLite, Keychain, push notifications (APNs), deep links, XCTest, Swift Package Manager, CocoaPods, Fastlane, GitHub Actions, CI/CD, TestFlight, App Store Connect, Git, Kotlin, iOS SDK

4DAT APP SUITE – SENIOR IOS DEVELOPER

FEBRUARY 2025 – JANUARY 2026

Industry: Consumer Apps, Asset Tracking & Computer Vision

Delivered a family of around ten SwiftUI iOS apps on a shared foundation — maintenance and record-keeping for boats, personal watercraft, homes, batteries and RF equipment, plus health trackers and a document / photo import tool.

- Established the common stack every app in the suite was built on: iOS 18/26, Swift 6 strict concurrency, SwiftUI-only UI, @Observable MVVM, UINavigationController with UINavigationControllerDelegate through the SwiftUI Environment, and SwiftData persistence.
- Extracted the shared layer into reusable Swift packages — a design system, an OCR pipeline and a photo viewer — so a new app in the family started from working components instead of a copy.
- Built the vision package as two products: image preprocessing (orientation, grayscale, contrast, thresholding, denoising, scaling) and recognition with a generic OCR path plus a dedicated display path for reading seven-segment device readouts.
- Structured each app around a use-case layer between view models and persistence, keeping business rules testable and independent of SwiftUI.
- Implemented domain logic per product — blood-pressure classification derived at display time rather than stored, home bill tracking with due-date surfacing and fast mark-as-paid, maintenance logs and service intervals for vehicles.
- Integrated AdMob banner monetisation across the suite: a GoogleMobileAds banner bridged into SwiftUI through UIViewRepresentable and anchored in the root view, with an observable monetisation store gating every ad request on UMP consent and App Tracking Transparency authorisation.

- Shipped subscription monetisation with StoreKit 2, and handled App Store Connect setup and release across the suite.

Technologies: Swift 6, SwiftUI, UIKit (UIViewRepresentable), SwiftData, SQLite, Swift Concurrency, Combine, Observation (@Observable), MVVM, NavigationStack / NavigationPath, dependency injection, Vision, Core ML, Core Image, Core Graphics, ImageIO, PhotosUI, AVFoundation, Swift Charts, MapKit, Core Location, Core Bluetooth, UserNotifications, CloudKit, CryptoKit, AuthenticationServices, Google Sign-In, StoreKit 2, Google AdMob (GoogleMobileAds), UMP consent, App Tracking Transparency, app extensions (File Provider), OSLog, Swift Testing, XCTest, Swift Package Manager, App Store Connect, TestFlight, Git, iOS 18 / iOS 26

MAILFLOW AUTOMATION – SENIOR SWIFT DEVELOPER

DECEMBER 2025 – JANUARY 2026

Industry: macOS Productivity

A macOS automation solution connecting Apple Mail to knowledge-management tooling — capturing incoming mail, extracting structured data and routing it into DEVONthink for consistent tagging and retrieval.

- Built end-to-end workflows in AppleScript and JavaScript for Automation (JXA), monitoring mailbox events and triggering rule-based actions on message metadata and content.
- Created DEVONthink ingestion pipelines that generate and update records, apply classification and tags, and maintain a structured knowledge base.
- Designed resilient parsing for variable formats, headers, attachments and real-world edge cases, with JavaScript-based transformation for the branching AppleScript alone could not express.
- Packaged reusable actions through Automator and Shortcuts for non-technical users while keeping script-level configurability for advanced cases.

Technologies: AppleScript, JavaScript for Automation (JXA), JavaScript, Apple Mail automation APIs, Apple Events, DEVONthink scripting, Automator, Shortcuts, macOS automation, regular expressions, text and MIME parsing, Script Editor, macOS development tools

ECLIPTIX – SENIOR SWIFT DEVELOPER

APRIL 2024 – JANUARY 2025

Industry: Secure Networking & Cryptographic Protocols

A security-critical Swift iOS client for encrypted client-server communication, OPAQUE authentication, end-to-end encrypted messaging and reliable gRPC streaming, built on a deterministic Rust SDK shared across platforms.

- Designed the gRPC networking layer with stable bidirectional streams, retry and reconnection logic, and consistent session handling.
- Integrated OPAQUE authentication so credentials are never exposed to interception or replay, and built UI to match — including a password field that never retains a plaintext value.
- Implemented secure in-memory secret handling via C++ / libsodium wrappers (SecureMemoryHandle), keeping plaintext out of memory dumps, logs and crash reports.
- Bridged the deterministic Rust SDK into iOS over a stable C ABI, defining memory ownership rules and error / result mapping fit for mobile constraints.
- Validated serialized payloads, cryptographic outputs and protocol messages against a reference C# implementation and golden test vectors to guarantee cross-platform determinism.
- Applied Swift Concurrency to isolate mutable state across networking and cryptographic operations, and packaged C++ crypto utilities as an XCFramework.

Technologies: Swift 6, SwiftUI, Swift Concurrency (async/await, Task, actor, Sendable, AsyncStream), gRPC-Swift, SwiftProtobuf, Protocol Buffers, bidirectional streaming, Rust, Rust FFI (C ABI), C/C++, libsodium, OPAQUE authentication, end-to-end encryption, cryptographic protocols, secure memory handling, XCFramework, modular architecture, protocol-oriented design, generics, JSON-based localisation, XCTest, Swift Package Manager, Xcode, Git, iOS SDK

PHOTOMATIC – SWIFT DEVELOPER

MARCH 2023 – MARCH 2024

Industry: Document & Photo Processing

Native macOS and iOS application for high-performance photo processing, identity-document workflows and secure data handling.

- Standardised navigation across SwiftUI NavigationStack and UIKit coordinators for deep links and multi-step flows, improving access to core workflows by 35%.
- Built a resilient REST layer on URLSession and async/await with cancellation, retries, caching and typed error mapping.
- Reworked the pipeline from network payloads through domain models to UI state, removing redundant transformations and cutting inconsistent state by 30%.
- Delivered offline-friendly UX with cached reads, fallback states and retry scheduling, reducing failed user actions by 15%.
- Enhanced photo preview and document-editing workflows with SwiftUI and AVFoundation for pre-finalisation review and export-ready output.

Technologies: Swift, SwiftUI, UIKit, MVVM, Coordinators, NavigationStack, deep links, Auto Layout, Swift Concurrency (async/await), URLSession, REST APIs, Codable / JSON, caching and offline support, Keychain, authentication and session management, AVFoundation, image processing, document workflows, XCTest, Swift Package Manager, CocoaPods, Xcode, Git, App Store Connect, iOS SDK, macOS SDK

LANGUAGES

English — B2 (Upper Intermediate). Ukrainian — Native.

EDUCATION

SEPTEMBER 2020 – DECEMBER 2024

Lviv Polytechnic National University — Bachelor of Science (BSc) in Software Engineering.
